Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 42.143; Variance 68.215; scale 0.618

CYCLIN-DEPENDENT KINASE 4 INHIBITOR A (CDK4I) (P16-INK4)
(TUMOR SUPPRESSOR CDKN2A).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sherburn T.E., Gale J.M., Ley R.D.;
Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: INTERACTS STRONGLY WITH CDR4 AND CDK6. INHIBITS THEIR
ABILITY TO INTERACT WITH CYCLINS D. COULD ACT AS A NEGATIVE
REGULATOR OF THE PROLIFERATION OF NORMAL CELLS (BY SIMILARITY).

-!- SUBUNIT: HETERODIMER WITH CDR4 OR CDK6 (BY SIMILARITY).

-!- ALTERNATIVE PRODUCTS: A SHORTER FORM MAY ARISE BY ALTERNATIVE
INITIATION CODONS IN THE SAME READING FRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

BLOCHAMISLY 38:2930-294.";

-1- FUNCTION: INTERACTS STRONGLY WITH CDK6, WEAKLY WITH CDK4. INHIBITS CELL GROWTH AND PROLIFERATION WITH A CORRELATED DEPENDENCE ON ENDOGROUS RETINOBLASTOMA PROTEIN RB.
-1- SUBUNIT: HETERODIMER OF P18 WITH CDK6.
-1- SUBUNIT: HETERODIMER OF P18 WITH CDK6.
-1- TISSUE SPECIFICITY: HIGHEST LEVELS FOUND IN SKELETAL MUSCLE. ALSO FOUND IN PANCREAS AND HEART.
-1- DISEASE: CDKN2C MUTATIONS ARE INVOLVED IN TUMOR FORMATION.
-1- SIMILARITY: BELONGS TO THE CDKN2 FAMILY OF CYCLIN-DEPENDENT KINASE
Venkataramani R., Swaminathan K., Marmorstein R.; "Crystal structure of the CDK4/6 inhibitory protein plBINK4c provides insights into ankyrin-like repeat structure/function and tumor-derived pl6inK mutations."; Nat. Struct. Biol. 5:74-81(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 45 MKLGNPEIARRLLLR-GANPDLKDRTGFA-VIHDAARAGFLDTLQTLLEFQADVNIEDNE 102

Landelli M., Dalstrand J., Lendahl U.;
The novel Notch homologue mouse Notch 3 lacks specific epidermal growth factor-repeats and is expressed in proliferating
                                                       Mech. Dev. 46:123-136(1994).

-1- FUNCTION: NOTCH 1, 2 AND 3 PLAY A COMBINATIONAL ROLE DURING VARIOUS CELL FATE DESIGNORS AND MORPHOLOGICAL MOVEMENTS IN T DEVELOPING CNS AND PROBABLY OTHER REGIONS OF THE EMBRYO.

-1- TISSUE SPECIFICITY: PROLIFERATING NEUROEPITHELIUM.

-1- DEVELOPMENTAL STAGE: CNS DEVELOPENT.

-1- SIMILARITY: CONTAINS 34 EGF-LIKE DOMAINS.

-1- SIMILARITY: CONTAINS 3 LIN/MOTCH REPEATS.

-1- SIMILARITY: CONTAINS 6 CDC10/SWI6 REPEATS.

A Blerkamp C., Campos-Ortega J.A.;
Blerkamp C., Campos-Ortega J.A.;

A zabrafish homologue of the Drosophila neurogenic gene Notch and its pattern of transcription during early embryogenesis.";

Mech. Dev. 43:87-100(1993).

-1 FUNCITON: IMPLICATED IN CELL FATE SPECIFICATIONS DURING EMBRYO DEVELOPMENT. MAY BE INVOLVED IN THE FORMATION OF THE NEURAL PLATE, NOTOCHORD AND BRAIN VESICLES.

-1 SUBCELLUIAR LOCATION: TYPE I MEMBRANE PROTEIN.

-1 DEVELOPMENTAL STAGE: EXPRESSED IN ALL CELLS IN PREGASTRULATION STAGES. DURING GASTRULATION IS DIFFERENTIALLY EXPRESSED, ACCUMULATING PREDOMINANTLY IN THE PRECHOPING MESODERM AND NOTOCHORD. AT THE END OF GASTRULATION, EXPRESSED ALONG THE ANTERIOR-POSTERIOR AND SASTRULATION, EXPRESSED ALONG THE ANTERIOR-POSTERIOR MESODERM. ALSO PRESENT IN THE DEVELOPING BRAIN AND DIFFERENTIATING MESODERM. ALSO PRESENT IN THE DEVELOPING STAILLARITY: CONTAINS 36 EGF-LIKE DOMAINS.

-1 SIMILARITY: CONTAINS 3 LINVOTCH REPEATS.

-1 SIMILARITY: CONTAINS 6 ANK REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (POTENTIAL). Mouse multiple tumour suppressor gene segment - useful for primer
Mouse multiple tumour suppressor 1 gene (MTS1) coding sequence. Muxine; multiple tumour suppressor 1 gene; MTS1; cancer; ss. Mus musculus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes mouse multiple tumour suppressor (MTS1) gene. The MTS1 gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, q110nma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys. 165 G; 99 T; sequence 507 BP; 86 A; 157 C; 165 G; 99 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                130 ATGATGATGGCCAACGTTCACGTAGCAGCTCTTCTGCTCAACTACGGTGC 179

PP Transcripts (see also T62486) homologous to human INK4A beta are conversible and cell DNA 11brary. Sequences of exon 1-beta are spliced to exon 2 to create an open reading frame that encodes a cythrologus converspressed. Unrelated sequences from a mouse crythrologusamia cell DNA 11brary. Sequences of exon 1-beta are spliced to exon 2 to create an open reading frame that encodes a novel protein, ARF-P19 (W16321), which induces cell cycle arrest when overexpressed. Unrelated sequences from exon 1-alpha (not spliced to the same exon 2 acceptor site to open another chown) are spliced to the same exon 2 acceptor site to open another reading frame that encodes InK41a-p16 (C-terminal fragment given in W16322), an inhibitor of the cyclin D-dependent Kinases CDK4 and CDK6. Economical reutilisation of protein coding sequences in this manner is without precedent in mammalian genomes and the unitary concerned the proteins in cell cycle control. ARF-P19 nucleic acids can be used as probes or primers, or in gene therapy protocols to induce cell arrest in eukaryotes or (antisense) to inhibit ARF-P19 activity, and to create transgenic animals useful as models for cancer. Human ARF-P19 CDA 223 G; 162 T;
                                                                                                                                                                                                                                                                                                                                                                      16-AUG-1997 (first entry)
Murine ARF-p19 cDNA.

Mouse p16 cDNA fragment.
MTS1; WTS2; WTS1E1-beta; multiple tumour suppressor; diagnosis; cancer;
germ-line mutation; familial melanoma locus; MLM; predisposition; ds.
cDNA (T0295) coding for the mouse cell-cycle regulatory (CCR) protein p13.5 (R85120) was isolated from an embryonal stem cellibrary using a probe based on human CCR p16 cDNA (T02962). The isolated cDNA can be used: to detect mutations in CCR genes that lead to cell proliferation, to bread transgenic animals to study cellular disorders involving CCR allele mutation/misexpression; and to correct CCR-deficient cells

DNA specific for Multiple Tumour Suppressor IEI-beta gene - are useful for the diagnosis of cancers related to MTSIEI-beta mutation(s) and their treatment to mutation(s) and their treatment bisclosure; Figure 14: 72pp; English.

This is a mouse pl6 cDNA sequence used in the characterisation of the human multiple tumour suppression proteins, MTSI, MST2 and MTSIEI-beta. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pencreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum.

This is the nucleotide sequence of a nucleic acid used in the method of the invention involving the used of the multiple tumour compares of the nucleotide sequence and treat human cancers. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. cran setul in the diagnosis and prognosis of patient samples.

The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy of the gene in cancers. The vectors can be used for gene therapy of strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used to construct production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein construct sequence 395 BP; 73 A; 109 C; 128 G; 85 T;

Design

Example 8; Fig 14; 80pp; English.

The present sequence encodes murine multiple tumour suppressor IEI-beta

The present sequence encodes murine multiple tumour suppressor IEI-beta

(MTSIEI-beta) protein. Primers designed from the gene can be used to
design primers to defect abnormalities i.e. polymorphisms which may
predispose towards malignancies such as melanoma, leukaemia,
astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast,
thyroid, pancreas, uterus and kidneys.

Defecting polymorphism associated with cancer pre:disposition - also DNA, vectors and host cells e.g. for gene or protein replacement therapy and drug screening claim 13; Pages 94-95; Id8pp; English.

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to exn 1 (T00737) or exon 2 (T00739) of the MTS1 gene. The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, Dreast and thyroid cancers, etc. .

With the following the following states of the paners of the process of the familiar and their treatment of the familiar treatment of the familiar and their treatment of the familiar bisclosure; Fig 6; 72pp; English.

Disclosure; Fig 6; 72pp; English.

This sequence encodes the human multiple tumour suppression protein, MTS1, exon 2. The MTS gene locus is also referred to as the familiar melanoma (MLM) gene locus; located on human chromosome 9p21. Germ line matations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glidoma, Hodgkin's lymphoma, Lit, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mutation(s)
Claim 1: Fig 6A-6B: 73pp: English.
Claim 1: Fig 6A-6B: 73pp: English.
This is the nucleotide sequence of the invention. The MTS gene
This is the nucleotide sequence of the invention. The MTS gene
is useful in the diagnosis and prognosis of human cancer. e.g. by
strandard nucleic hybridisation techniques, of patient samples. The
mutated sequences are those that are present in somatic mutations
of the gene in cancers. The vectors can be used for gene therapy
strategies to replace function of mutated protein in patients. These
can also be used to construct protein mimmetics, also for therapeutic
strategies. In addition the expression constructs can also be used
for recombinant production of MTS. Recombinant MTS can be used to
screen for drugs to be used for cancer therapy, and the protein
itself may also be used to restore MTS function in a cell.

    The present sequence represents part of intron 1, exon 2 and part of intron 2 for a human multiple tumour suppressor 1 (MTS1) gene. The MTS1 sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.

Detecting polymorphism associated with cancer pre:disposition - also DNA, vectors and host cells e.g. for gene or protein replacement therapy and drug screening and drug screening. Disclosure; Pages 111-112; 148pp; English. An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTS1 con a bove assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and

mutation(s) and their treatment to mislificate and mutation(s) and their treatment.

Disclosure; Column 89-90; 72pp; English.

This CDNA sequence encodes a variant of the human multiple tumour suppression protein, WTS1. The WTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21.

Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyrold, ovary, uterus, testis, kidney, stomach and rectum.
                                                                                                                                                                  15-JUL-1998 (first entry)
Human MTS1 cDNA variant.

This is the nucleotide sequence of the invention. The MTS gene (MTS-1) gene, used in the method of the invention. The MTS gene (S susful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridistation techniques, of patient samples. The untated sequences are those that are present in sometic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapoutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to restrain a cerembinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein constructs of the protein cons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids based on multiple tumour suppressor, MTS, sequences useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS

The present sequence represents the cDNA sequence for a human multiple
The present sequence represents the cDNA sequence for a human. The gene
tumour suppressor 1 (MTS1) gene, including noncoding portions. The gene
can be used to design primers to detect abnormalities 1.e. polymorphisms
which may predispose towards malignancies such as melanoma, leukaemia,
aktrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast,
thyroid, pencreas, uterus and kidneys.

LOCUS AI198233 579 bp mRNA EST 02-DEC-1998
DEFINITION q155412.11 NCI_CGAP_BRID5 Home sapiens cDNA clone IMAGE:1860407 3'
Similar to TR:Q16361 Q16361 CELL CYCLE NEGATIVE REGULATOR BETA FORM
CONTAINS LTR9.b3 TAR1 TAR1 repetitive element ;, mRNA sequence.
    and cloned into
adaptors (Pharmacia), digested with Not I and cloned int the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized, and was constructed by Bento Soares and M.Fatima Bonaldo."

/note="Organ: colon; Vector: pT7T3D-pac (Pharmacia) with a modified polylinker; Site=1: Not I; Site_2: ECO RI; Plasmid DNA from the normalized library NCI_CGAP_Co10 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1057416-1061255, and 1144584-1145351).
Subtraction by Bento Soares and M. Fatima Bonaldo. "
